1. Final Report – MyHealth Tracker

1.1 Abstract

MyHealth Tracker is an internet-based wellness monitoring application that aims to assist people in tracking daily routines. Such as meals, physical activity, drinking water and mood. Data visualisations enable the application to give power to users. So that they can track behavioural patterns and promote a healthier life. The MERN stack was used to create it. The project was implemented using (MongoDB, Express.js, React, Node.js), done in three phases, namely concept phase, development phase, and finalisation phase.

- In Phase 1, foundations were laid towards the app. It had a summary of half a page of problems, including user targeting.
- Technical concept, visual system architecture. The idea was based on the development of a complete solution for people between the ages of 18 and 45
- To control their everyday health activities, it focuses on simplicity and cross-device responsiveness.
- The second phase was implementation. A web application with a complete stack was developed, and the users can log their health activities through forms.
- All the entries are stored on MongoDB Atlas and presented in an interactive dashboard that includes tables and visualisations powered with Chart.js.
- The backend is RESTful, allowing adding, deleting and accessing of logs. Functionality was checked during testing, and a screencast was provided to show features live.
- Phase 3 was the completion of submission. It involved the consolidation of reports and, full project zip.
- Reflection, preparing of final deliverable such as the abstract and updated documentation.
- There was an evaluation of improvements and enhancements, and plans for deployment were assessed.

2.1 Reflection & Evaluation

The project showed a good correspondence with the learning outcomes throughout the development lifecycle. Such as full-stack problem-solving, APIs, and efficient use of them, managing GitHub versioning, and representation of data in a meaningful way. Debugging and time management were more of a challenge, particularly with the connection of MongoDB, but they have been overcome due to documentation and testing iterations. The cooperation and future-proofing were made easy because of the idea of modular architecture. The use of a separate folder structure (Concept, Development, Finalisation) made it clear and easy to review. The code is kept clean, version-controlled and well-commented.

3.1 Results & Screenshots

Key Functionalities Achieved:

- Add logs with meals, mood, exercise, and water intake
- View logs in a tabular format
- Visualise weekly summaries using Chart.js
- Data persistence with MongoDB Atlas
- RESTful API integration

Meal	Exercise	Mood	Water (ml)	Add Entry
------	----------	------	------------	-----------
